January 2015 thru December 2015

This table compares air emissions from this supplier's electricity mix to average emission levels from all Regional power sources.

	<u>Supplier's Mix (lbs/MWh)</u>
Carbon Dioxide (CO2)	853.25
Nitrogen Oxide (NOx)	0.823
Sulfur Dioxide (SO2)	1.14

Notes: lbs/MWh = pounds per Megawatt-hour
1 Megawatt-hour = 1,000 kilowatt-hours

Additional Information and Required Notes

Power Sources - Maine law requires retail electricity providers to periodically provide information to their customers on the mix of power sources used by the provider to serve their Maine customers' load.

Emissions - **Carbon Dioxide (CO2)** is released when certain fuels are burned. It is considered a major greenhouse gas and a major contributor to global warming. **Nitrogen Oxides (NOx)** form when certain fuels are burned at high temperatures. They are considered contributors to acid rain and ground-level ozone (or smog). **Sulfur Dioxide (SO2)** is formed when fuels containing sulfur are burned. Major health effects associated with SO2 include asthma, respiratory illness and aggravation of existing cardiovascular disease. The production of electricity can produce harmful emissions and have other environmental impacts. Environmental impacts differ among different power plants.
